

# SQL PROJECT

By-Danish Rana

Topic- Analysed the current mining scenario in Australia  
by using SQL.

# Table used in this project-

- 1. Mining Employment

```
SELECT * FROM mining_db.mining_employment;
```

	State_Territory	Employment_Thousands	Percentage_Total_Workforce
▶	Western Australia	125	4.50
	Queensland	90	3.80
	New South Wales	60	1.50
	Victoria	20	0.50
	South Australia	15	1.00

## 2. Mining Accidents

```
SELECT * FROM mining_db.mining_accidents_safety;
```

	Year	Fatalities	Major_Injuries	Minor_Injuries
▶	2020	5	25	300
	2021	4	20	280
	2022	6	30	310
	2023	3	15	290

### • 3. Mining Companies

```
SELECT * FROM mining_db.major_mining_companies;
```

Result Grid     Filter Rows: <input type="text"/>   Export:    Wrap Cell Content: 				
	Company_Name	Headquarters	Main_Commodities	Established_Year
▶	BHP Group	Melbourne	Iron ore, coal, copper	1885
	Rio Tinto	Melbourne	Iron ore, aluminium	1873
	Fortescue Metals Group	Perth	Iron ore	2003
	Newcrest Mining	Melbourne	Gold, copper	1966
	South32	Perth	Aluminium, coal	2015

### 4. Mineral produced

```
SELECT * FROM mining_db.key_minerals_produced;
```

Result Grid     Filter Rows: <input type="text"/>   Export:    Wrap Cell Content: 			
	Mineral	Production_Volume_Million_Tonnes	Export_Value_Billion_AUD
▶	Iron Ore	900.00	120.00
	Coal	450.00	70.00
	Gold	330.00	25.00
	Bauxite	110.00	15.00
	Copper	50.00	10.00

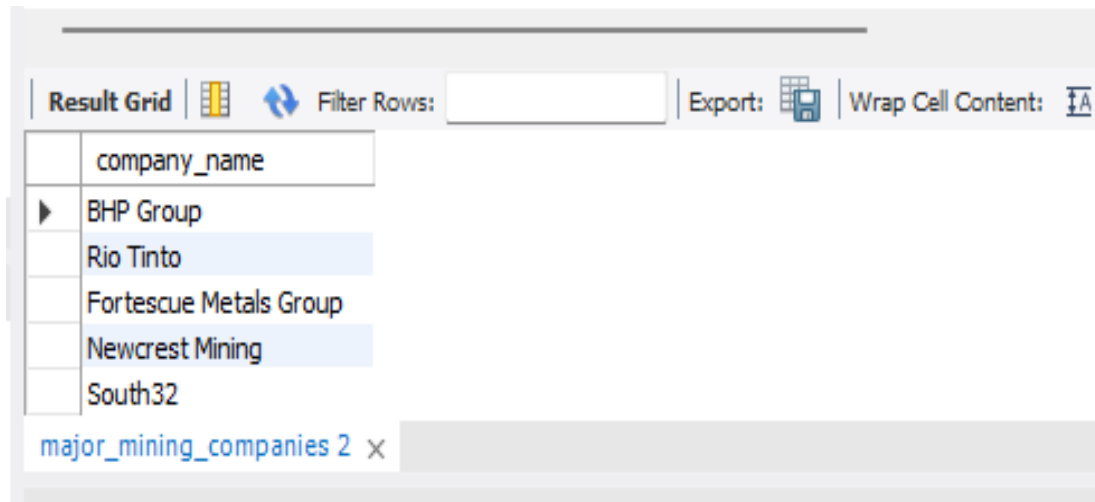

## 5.Environmental Impacts

```
SELECT * FROM mining_db.environmental_impact;
```

Result Grid     Filter Rows: <input type="text"/>   Export:    Wrap Cell Content: 				
	State_Territory	CO2_Emissions_Million_Tonnes	Land_Area_Disturbed_km2	Water_Usage_Billion_Litres
▶	Western Australia	50.00	120.00	500.00
	Queensland	35.00	90.00	350.00
	New South Wales	25.00	60.00	200.00
	Victoria	10.00	30.00	150.00
	South Australia	5.00	20.00	100.00

# 1. Major Mining Companies in Australia-

```
select * from major_mining_companies;  
select company_name from major_mining_companies  
where established_year < 2020;
```

The screenshot shows a database interface with a 'Result Grid' tab. The grid displays the results of a query, showing the 'company\_name' column. The companies listed are BHP Group, Rio Tinto, Fortescue Metals Group, Newcrest Mining, and South32. The interface includes a 'Filter Rows' section, an 'Export' button, and a 'Wrap Cell Content' option.

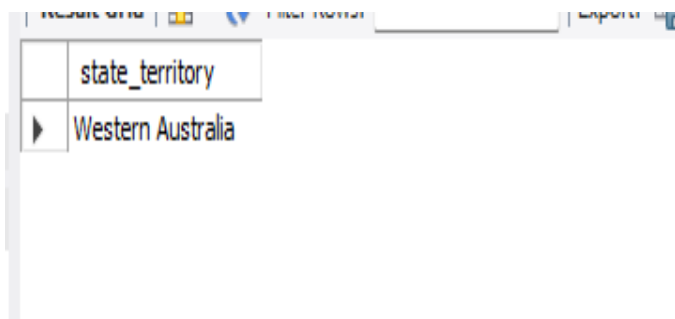

company_name
BHP Group
Rio Tinto
Fortescue Metals Group
Newcrest Mining
South32

major\_mining\_companies 2 x

## 2. Mining Employment in Australia in 2023-

We have to write a SQL query to find the state/territory with the highest mining employment.

```
select * from mining_employment;  
select state_territory from mining_employment  
order by percentage_total_workforce desc  
limit 1;
```

The screenshot shows a database query result window. At the top, there are tabs for 'Results (1 row)', 'Query', and 'Export'. Below the tabs, the results are displayed in a table with two columns: 'state\_territory' and 'percentage\_total\_workforce'. The first row shows 'Western Australia' with a value of 1.000000.

state_territory	percentage_total_workforce
Western Australia	1.000000

3. Write a SQL query to calculate the total mining employment in Australia.

- Here we have to use sum() function to calculate the total mining employment.

```
select * from mining_employment;  
select sum(employment_thousands) as total_employment  
from mining_employment;
```

	total_employment
▶	310

## Key mineral produce(2023)

4. Write a SQL query to list all minerals that have an export value greater than 20 billion AUD.

```
select * from key_minerals_produced;  
select mineral from key_minerals_produced  
where Export_Value_Billion_AUD > 20;
```

	mineral
▶	Iron Ore
	Coal
	Gold

## Combining Datasets-

5. Write a SQL query to list the states/territories along with their total mining employment and CO2 emissions.

In this question we have to use the concept of inner join.

```
select * from mining_employment;  
select * from environmental_impact;  
select e.state_territory, e.employment_thousands, i.CO2_emissions_million_tonnes  
from mining_employment as e  
join environmental_impact as i  
on e.State_Territory=i.State_Territory;
```

Result Grid			
		Filter Rows:	
		Export:	
		Wrap Cell Content:	
	state_territory	employment_thousands	CO2_emissions_million_tonnes
▶	Western Australia	125	50.00
	Queensland	90	35.00
	New South Wales	60	25.00
	Victoria	20	10.00
	South Australia	15	5.00

Result 15

## Subquery to Find Maximum Employment

6. Write a SQL query to find the state/territory with the highest mining employment.

```
select * from mining_employment;  
select state_territory from  
mining_employment  
where employment_thousands in (select max(employment_thousands) from mining_employment);
```

Result Grid			Filter Rows: <input type="text"/>	Export: 	Wrap Cell Content: 
	state_territory				
▶	Western Australia				

7. Write a SQL query to list all minerals with an export value above the average export value of all minerals.

```
select * from key_minerals_produced;
select mineral
from key_minerals_produced
where export_value_billion_AUD >
(SELECT AVG(export_value_billion_AUD) from key_minerals_produced);
```

Result Grid		Filter Rows:	Export:	Wrap Cell Content:
mineral				
▶ Iron Ore				
Coal				

## Window Function-

8. Write a SQL query using a window function to calculate the cumulative employment in mining across states/territories, ordered by employment.

```
select * from mining_employment;
SELECT State_Territory, Employment_Thousands,
       SUM(Employment_Thousands) OVER (ORDER BY Employment_Thousands) AS Cumulative_Employment
FROM Mining_Employment
ORDER BY Employment_Thousands;
```

Result Grid				Filter Rows:	Export:	Wrap Cell Content:
	State_Territory	Employment_Thousands	Cumulative_Employment			
▶	South Australia	15	15			
	Victoria	20	35			
	New South Wales	60	95			
	Queensland	90	185			
	Western Australia	125	310			

# Application of window function in SQL

9. Write a SQL query using a window function to rank the states/territories by CO2 emissions.

- `select * from environmental_impact;`
- `select state_territory, CO2_emissions_million_tonnes, rank() over(order by CO2_emissions_million_tonnes) as emission_rank from environmental_impact;`

Result Grid	Filter Rows:	Export:	Wrap Cell Content:
state_territory	CO2_emissions_million_tonnes	emission_rank	
South Australia	5.00	1	
Victoria	10.00	2	
New South Wales	25.00	3	
Queensland	35.00	4	
Western Australia	50.00	5	

10. Write a SQL query using a window function to calculate the rolling average of minor injuries over the years.

```
SELECT Year, Minor_Injuries,
       AVG(Minor_Injuries)
       OVER (ORDER BY Year ROWS BETWEEN 1 PRECEDING AND 1 FOLLOWING) AS Rolling_Avg_Minor_Injuries
FROM Mining_Accidents_Safety
ORDER BY Year;
```

Result Grid	Filter Rows:	Export:	Wrap Cell Content:
Year	Minor_Injuries	Rolling_Avg_Minor_Injuries	
2020	300	290.0000	
2021	280	296.6667	
2022	310	293.3333	
2023	290	300.0000
